

## Abstract

An educational calendar includes a base having a display surface, and the display surface is divided into three areas. A first area has indicia of months of the year, a second area having an indicia of days of the week, and a third area having  
5 indicia of dates of a month. An arrangement of each of the months, days, and dates in each respective area is mutually unrelated to each other so that the location of a day of the week is unrelated to dates of the month. Borders or other identifiers are used to identify the month, day, and day.
